Summary

Context

SBBDSBC-LOGOS, ipg

- Depression is one of the most reported mental diseases in the world. Sometimes called century illness^a and the third lead cause of disability [?].
- Depression afflicts more certain groups than others, e.g. women to men. Europeans to Africans, people with more income.
- World Health Organization (WHO) presents that around 300 mi people suffer from some level of depression^b.
- Health Ministry in Brazil presents that 11.5 million people are affected by depression.^c

- People share with other users their social interests and preferences on Social Media.
- Plenty of data about behaviour, habits, interests, friendship and so on. Lima Filho, Oliveira and Ferreira | Detection of Depression Symptoms using Social Media Data | PPGI, UFRJ

Context

SBBDSBC-LOGOS.jpg

- Horvitz report infodemiology as the use of digital information to inform the population about health policies, earlier epidemics identification and identify potentially affected individuals[?].
- Lech & Eds present two main challenges in mental health informatics. Provide health care services to remote and non-assisted populations, and turn health services more effective on cost[?].

Applications of Mental Health Informatics

- Telemedicine
- Automatizes Evaluation Systems
- Online Support and Information Management

Initial Research Questions

SBBDSBC-LOGOS.jpg

Is it possible to identify psychological diseases symptoms, more specifically depression symptoms, from social media users content?

The collected information from social media is sufficiently robust to determine if a user has depression or its symptoms?

Which computational methods and efforts were created or used to understand emotional behavior from a social media user?

Justification

SBBDSBC-LOGOS.jpg

Academic Relevance

This work intend to contribute mainly on social network area, and somewhere between machine learning and recommendation systems. For studying if social media data is adequate to comprehend a person behaviour related to depression.

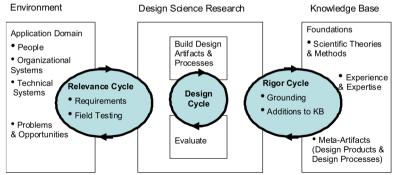

Practical Relevance

Prior contribution(academic) can improve how data is consumed by professionals in health service as psychologists and physicians, and also can auxiliate in order to construct more accessible health services to groups of people with less resources.

Methodology

SBBDSBC-LOGOS.jpg

Design Science Research (DSR) was selected due to its pragmatical approach for a given context. Based on [?], we can identify the three cycles in order to create at the end, an relevant artifact. Pimentel et al. [?] has presented an overview of different aspects of DSR from many authors. Moreover the authors suggest a framework to implement DSR in a research topic.

Methodology

SBBDSBC-LOGOS.jpg

Peffers[?] states the research process in six stages. The author specifically proposes a Design Science Research Methodology (DSRM).

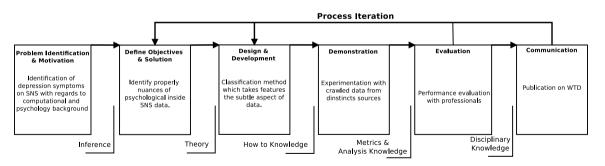

Figure: Research stages based on DSRM from [?].

Methodology

SBBDSBC-LOGOS.jpg

We establish which cycles will comprehend each component to fullfill DSR requirements. Taking into account Wieringa approach [?].

- Systematic Literature Review Related to Empirical Cycle
- Experiments to test and validate initial classification models Related to Design/Engineering Cycle.

Research Questions

- Is it possible to identify symptoms of psychological diseases on social media platforms?
- Is there a diagnosis method which only uses social media data?
- Would the social media platform be useful for professionals?
- Assuming there exist such methods, which type of techniques are used on them?
- •
- What and how is composed the state of the art?

SBBDSBC-LOGOS.jpg

Still in progress.

- ("Social Media" OR "Social Network" OR "Complex Network") AND (Depression OR "Major Depressive Disorder")
- 2013 ≥ *published* ≤ 2018
- 22 from ACM and 25 from IEEE bases

Inclusion	Exclusion
Directly tackles depression	Out of 2013-2018 scope
Have computational approach	Not written in english or portuguese
Attend both approaches	It is not a primary study
-	It does not have abstract
-	It does not have computing contribution
-	It has less than 4 pages

Table: SLR criteria for inclusion and exclusion.

SBBDSBC-LOGOS.jpg

Chen et al. have detected eight basic emotions and calculated the overall intensity (strength score) of the emotions extracted from all past tweets of each user[?].

Approach

- "...identify users with or at risk of depression by incorporating measures of eight basic emotions as features from Twitter posts over time, including a temporal analysis of these features."
- Data obtained from expressions: "I was/have been diagnosed with depression."
- Contributions:
 - Emotions are the analyzed features
 - Data analysis over time
 - Explore how time series analysis can help on task of identify depressive users
- Features:
 - Non-temporal: 9 entries emotion feature vector (emotions + Emotion Overall Score)
 - Temporal: Timestamp for each emotion score

SBBDSBC-LOGOS.jpg

Vedula and Parthasarathy conduct an observational study to understand the interactions between clinically depressed users and their ego-network when contrasted with a group of users without depression. They identify relevant linguistic and emotional signals from social media exchanges to detect symptomatic cues of depression[?].

Approach

Examine network effects related to:

- participation (passive: tweets a user is exposed to, retweets or mentions a user receives; active: mentions, retweets and conversations made by the user)
- engagement (content (e.g., linguistic cues, emotion) and relational dynamics (e.g., conflict/support, influence))
- Ego-neighborhood (size, centrality and affinity to form clusters or communities)

SBBDSBC-LOGOS.jpg

De Choudhury et al. have used crowdsourcing to obtain data from twitter by people who were clinically diagnosed with depression. They also have constructed a corpus and developed a probabilistic model. The trained model classifies if a post indicates depression[?]. Similarly, et al have applied the same analysis to replicate the results in a group of japanese users[?].

• Problem:

- Characterize levels of depression in populations.
- Approach:
 - Crowdsourcing to build a large corpus of postings on Twitter that have been shared by individuals diagnosed with clinical depression.
 - Probabilistic model trained on this corpus to determine if posts could indicate depression
 - Social media depression index that may serve to characterize levels of depression in populations

1st Cycle

- Análise Textual Identificação de emoções/sentimentos Assuntos abordado (completar)
- Conteúdo Horário da postagem Local Privacidade do conteúdo ... (completar)
- Perfil do Usuário Gênero Local Idade Estado do Relacionamento (por exemplo: solteiro) ... (completar)
- Comportamental (do usuário perante a plataforma) Quantidade de mudanças do estado do relacionamento Horário que fica online . . . (completar)
- Interação com Outros Número de grupos que participa Número de fotos onde foi marcado Quantidade de amigos Quantidade de seguidos/seguidores ... (completar) Métricas de redes sociais referentes ao nó (por exemplo, grau do nó) ... (completar)
- Características do grupo Métricas de redes sociais referentes ao grupo (por exemplo, densidade, modularidade, etc.) ... (completar)
- Variação Longitudinal (Variação ao longo do tempo) Sim/Não Período (sazionalidade)

Literature Gaps

- Not all the analyzed researches take into account the psychology point of view.
- Use of psychometrics only
- Would the screening of depressive users be more robust and reliable if they take others psychology approaches?
- Is it possible to identify the same symptoms from clinical using computational techniques?
- Aggregated Data Analysis vs Individual Data Analysis

Contribution Proposal

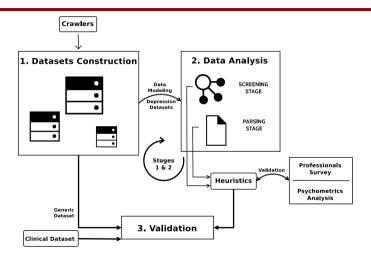

Figure: Proposal Conceptual Model

Technical Challenges

- Validation with clinical data
- Datasets to train classification model
- Reliable data, taking into account people consent
- Improve Computer Science area

Schedule

- Submission to WTD on SBBD (08/07)
- Proposal writing In progress First issue 15/07
- Qualification End of August
- Ending of 1st Cycle
- Ending of 2nd Cycle

Backup Abstraction of Studies

- BE INCLUDED 1) Classificação dos trabalhos encontrados no mapeamento, ressaltando: Objetivo do trabalho, Abordagem utilizada, Técnicas utilizadas (algoritmos e métricas), Principais desafios levantados (ou trabalhos futuros).
- 2) A partir do material que vc. leu, destacar o conjunto de teorias/referências que vão embasar o seu problema e a sua motivação (Conjecturas Teóricas)
- 3) Quadro explicativo, com as métricas/features que os trabalhos relacionados usam e as métricas/features que vc. pensou em incluir na sua proposta. Este quadro deve ter: o nome da métrica/feature, explicação sucinta sobre a métrica/feature, referência (ao trabalho que a usou), justificativa do seu uso.
